

# What is HD?

Huntington disease (HD) is an inherited disorder that causes cells in specific parts of the brain to die. The HD gene is dominant, which means that each child born to a parent with HD has a 50% chance of sharing the same fate. This is the most devastating disease known to man. HD disrupts the brain which will take away a person's ability to think, speak, walk, run, make decisions and control one's body; memories become effectively locked-in because the brain can no longer access them.

Every child born to a parent with Huntington disease has a 50% chance of sharing the same fate.

**More than ever, now is the time to step up the fight against HD!**
